9
10      It is all fun and games until someone gets hacked!
11
12  -----
13  Explanations:
14
15  cache: If you include other words in the query, Google will highlight those words within
16         the cached document. For instance, [cache:www.google.com web] will show the cached
```

17 content with the word "web" highlighted. This functionality is also accessible by
18 clicking on the "Cached" link on Google's main results page. The query [cache:] will
19 show the version of the web page that Google has in its cache. For instance,
20 [cache:www.google.com] will show Google's cache of the Google homepage. Note there
21 can be no space between the "cache:" and the web page url.
22 -----
23 link: The query [link:] will list webpages that have links to the specified webpage.
24 For instance, [link:www.google.com] will list webpages that have links pointing to the
25 Google homepage. Note there can be no space between the "link:" and the web page url.
26 -----
27 related: The query [related:] will list web pages that are "similar" to a specified web
28 page. For instance, [related:www.google.com] will list web pages that are similar to
29 the Google homepage. Note there can be no space between the "related:" and the web
30 page url.
31 -----
32 info: The query [info:] will present some information that Google has about that web
33 page. For instance, [info:www.google.com] will show information about the Google
34 homepage. Note there can be no space between the "info:" and the web page url.
35 -----
36 define: The query [define:] will provide a definition of the words you enter after it,
37 gathered from various online sources. The definition will be for the entire phrase
38 entered (i.e., it will include all the words in the exact order you typed them).
39 -----
40 stocks: If you begin a query with the [stocks:] operator, Google will treat the rest
41 of the query terms as stock ticker symbols, and will link to a page showing stock
42 information for those symbols. For instance, [stocks: intc yhoo] will show information
43 about Intel and Yahoo. (Note you must type the ticker symbols, not the company name.)
44 -----
45 site: If you include [site:] in your query, Google will restrict the results to those
46 websites in the given domain. For instance, [help site:www.google.com] will find pages
47 about help within www.google.com. [help site:com] will find pages about help within
48 .com urls. Note there can be no space between the "site:" and the domain.
49 -----

```

50 allintitle: If you start a query with [allintitle:], Google will restrict the results
51     to those with all of the query words in the title. For instance,
52     [allintitle: google search] will return only documents that have both "google"
53     and "search" in the title.
54 -----
55 intitle: If you include [intitle:] in your query, Google will restrict the results
56     to documents containing that word in the title. For instance, [intitle:google search]
57     will return documents that mention the word "google" in their title, and mention the
58     word "search" anywhere in the document (title or no). Note there can be no space
59     between the "intitle:" and the following word. Putting [intitle:] in front of every
60     word in your query is equivalent to putting [allintitle:] at the front of your
61     query: [intitle:google intitle:search] is the same as [allintitle: google search].
62 -----
63 allinurl: If you start a query with [allinurl:], Google will restrict the results to
64     those with all of the query words in the url. For instance, [allinurl: google search]
65     will return only documents that have both "google" and "search" in the url. Note
66     that [allinurl:] works on words, not url components. In particular, it ignores
67     punctuation. Thus, [allinurl: foo/bar] will restrict the results to page with the
68     words "foo" and "bar" in the url, but won't require that they be separated by a
69     slash within that url, that they be adjacent, or that they be in that particular
70     word order. There is currently no way to enforce these constraints.
71 -----
72 inurl: If you include [inurl:] in your query, Google will restrict the results to
73     documents containing that word in the url. For instance, [inurl:google search] will
74     return documents that mention the word "google" in their url, and mention the word
75     "search" anywhere in the document (url or no). Note there can be no space between
76     the "inurl:" and the following word. Putting "inurl:" in front of every word in your
77     query is equivalent to putting "allinurl:" at the front of your query:
78     [inurl:google inurl:search] is the same as [allinurl: google search].

Nice

But, if you want to become a google dorks expert.

you must need to watch this video -

here is the link => <https://www.youtube.com/watch?v=B9xJ54aGppc> & <https://www.youtube.com/watch?v=VSZyeYnZk3c>

What You will learn from this video ?

- *how google dorks works

- *how to use google dorks for penetration testing

- *how to use google dorks for security searching
- *how much google dorks is powerful
- *find vulnerable website using google dorks
- *find someones information with google dorks
- *how to use google dorks for information gathering
- *database exploit with google dorks
- *how to become a expert of google dorks searcher
- *do mastering at google dorks

A thanks is more appreciate :)

larsonreever commented on Apr 7, 2017

Thanks for the dorks but many of these dorks do not work in google now and are rendered obsolete, the database for dorks need to be constantly updated as dorks continue to evolve due to advent of new technologies and vulnerabilities anyways...Thanx for the useful info

Thanks

LarsonR
