### Top 3 Open Source SSL Testing Tools

📅 May 28, 2019 👤 H4ck0 💬 Comment(1)

Security, privacy and data integrity are important properties of today's Internet applications and protocols. The security and confidentiality of millions of Internet transactions per day depend upon the

Secure Socket Layer (SSL)/Transport Layer Security (TLS) protocol.

Over the past few years, the SSL protocol has been subject to a series of successful attacks by security researchers, some exploiting flaws in deployed systems while others made use of social engineering and other forms of deception.

As the Internet is being used for many commercial activities, such as shopping, online banking, or electronic trading, the value of data has increased. Networking protocols and applications are therefore increasingly expected to protect critical data by providing encryption, data integrity, and, most importantly, entity authentication.

*Suggested Read: [Installation and Configuration of Free SSL – sslforfree.com](https://sslforfree.com)*

As these security goals are difficult to attain, application developers and protocol designers often rely on well-established security layers below their own protocols. The SSL and TLS protocol suites are used by many applications and protocols to provide a certain level of security, as they build on well-understood and thoroughly-analyzed cryptographic algorithms.

*Always keep in mind that, although HTTP protocol is the protocol, which highly makes use of SSL, to secure communication. SSL is an application layer independent protocol. So you can use that with any application layer Protocol.*

Basically SSL have three levels of security, that is:

- **Authentication:** Ensures that the received message is coming from someone who express.

» Overview of Mobile Learning Platforms

- **Confidentiality:** Protecting a message from a business reading by unauthorized recipients along the journey.
- **Integrity:** Ensuring that the original message, do not change along the way.

Here we've listed out top 3 open source SSL scanners through which you can easily test your SSL/TLS server security.

## 1. SSLYZE

SSLyze is one of the most powerful SSL/TLS server scanning command line tool which analyze the SSL Configuration of a server through which you can easily identify all the vulnerabilities, misconfigurations etc against your SSL server.

SSLyze has already been tested on various platforms like Debian 7, macOS High Sierra and Windows 10.

**Github Link** – <https://github.com/nabla-c0d3/sslyze>

Installation can easily be done directly via pip tool as follows:

```
Command: pip install --upgrade setuptools
```

```
Command: pip install --upgrade sslyze
```

Or you can directly clone the repository by run the following command:

```
Command: git clone https://github.com/nabla-c0d3/sslyze
```

```
Command: cd sslyze
```

**Command:** pipenv install -dev

**Command:** pipenv shell

## 2. SSLSCAN

SSLScan is designed to be easy, lean and fast. The output includes preferred ciphers of the SSL/TLS service, and text and XML output formats are supported. It is TLS SNI aware when used with a supported version of OpenSSL.

And you can even automate the whole process of conducting ssl scanning via [Auto-sslscan](#) which parses an nmap.xml output file, extracts all SSL services and automatically performs an sslscan.

**Github Link** – <https://github.com/rbsec/sslscan>

```
[root@barebone sslscan]# ./sslscan
```

```
1.11.10-rbsec-7-g3fe5d00-static  
OpenSSL 1.0.2-chacha (1.0.2g-dev)
```

**Command:**

```
./sslscan [Options] [host:port | host]
```

**Options:**

```
--targets=<file>      A file containing a list of hosts to check.  
                      Hosts can be supplied with ports (host:port)  
--sni-name=<name>     Hostname for SNI  
--ipv4                Only use IPV4  
--ipv6                Only use IPV6  
--show-certificate    Show full certificate information  
--no-check-certificate Don't warn about weak certificate algorithm
```

You can directly install this tool by run the following command:

```
Command: apt install sslscan
```

If for whatever reason you can't install the above said package, follow the instructions [here](#) for statically building against OpenSSL.

### 3. TESTSSL

It is a free command line tool which checks almost all major vulnerabilities like Heartbleed, CRIME, BREACH, Poodle, Beast etc. Testssl.sh script is pretty much portable and compatible with every Linux, Mac OS X and FreeBSD.

**Github Link** – <https://github.com/drwetter/testssl.sh>

**Installation** – To install this tool, run the following command in your terminal:

```
Command: git clone --depth 1 https://github.com/drwetter/testssl.sh.git
```

```
Testing now (2015-09-16 02:27) ---> 81.169.199.25:443 (testssl.sh) <---
rDNS (81.169.199.25):  testssl.sh.
Service detected:      HTTP

--> Testing HTTP header response @ "/"

HTTP Status Code      200 OK
HTTP clock skew        -1 sec from localtime
Strict Transport Security 362 days=31337000 s, just this domain
Public Key Pinning     # of keys: 2, 30 days=2592000 s, just this domain
                       matching host key: WwV39oyQzKmrclC5CU7NImVeJlbGZ/mwAnfwMpNOw
Server banner          Never trust a banner
Application banner      X-Powered-By: A portion of humor
Cookie(s)              (none issued at "/")
Security headers        X-FRAME-OPTIONS: DENY
                       X-XSS-Protection: 1; mode=block
                       X-Content-Type-Options: nosniff

Reverse Proxy banner    --

Done now (2015-09-16 02:27) ---> 81.169.199.25:443 (testssl.sh) <---
```

To test all vulnerabilities, the command is:

```
Command: ./testssl.sh -U <https://example.com>
```

In case, if you want to test a particular vulnerability, Let's for example Heartbleed, then the command would be:

```
Command: ./testssl.sh -B <https://example.com>
```

For more information about this tool, you can refer to <https://testssl.sh> official website.
