Do you want to find the perfect mobile penetration testing toolkit…??? Searched all over the internet just to find pranking apps and fake hacking apps. Now its time to learn hacking android by using a professional tool.

Fear not, Hacking world has found the ultimate tool for hacking on the go

Introducing

Content At Glance

ZANTI- The mobile pentesting Toolkit

zANTI is a penetration testing tool or hacking tool that allows you to perform malicious attacks on a network. You can also use zANTI to exploit routers, Audit passwords, create and run an HTTP server on your

Android device, scan a device for open ports, check the device for shellshock and SSL poodle vulnerability. In-short this Android application is the perfect application for hackers for all their fantasies.

Let's first see what exactly can you do using zANTI-

1. Hijack HTTP Sessions via MITM
2. Capture Downloads
3. Modify HTTP requests and responses via MITM
4. Exploit routers
5. Hack Passwords
6. Check a Device for Shellshock and SSL Poodle Vulnerabilities
7. Do a nmap detailed scan

Disclaimer:
Please be aware that hacking is illegal unless you have permission from the account owner and the parties involved. This post should be used as a tool to help the public understand how hackers are gaining access to your passwords and hack various passwords. The Hacking world team shall not be held responsible if any criminal charges are

brought against any person who misuses the information on this website to violate the law.

---

1) Installing zanti Toolkit

Step 1: Go to the official website of zanti Toolkit

Link: https://www.zimperium.com/zanti-mobile-penetration-testing

Step 2: Enter your email address.

Step 3: A download link will become available.

Step 4: Download the apk file on your phone.

Step 5: Click the checkbox install from unknown sources if the installation is blocked.

Step 6: Install the apk file.

Step 7: Open the app give it supersu permissions and connect to the wifi network.

Following features are available on zanti:

1) Hijack HTTP Sessions using MITM-

So basically here you can redirect all the HTTP traffic to a specific server or a site. By default as soon as you ON "Redirect HTTP." But you can also redirect it to a particular website by tapping on the settings icon, then there you will find space for URL. Put the URL in the space, and you are good to go. You can also redirect https to HTTP to make the network less secure and more comfortable for you to hack.

ANTI Linux 3.2 - 4.4@192.168.225.1

MITM

Rename target

2) Capture Downloads-

This feature will allow you to tap into the host's download folder and get a copy of whatever you want in your system. For example, if you select ".pdf" from the menu and click on capture download, then all the pdf's will be downloaded in your phone. This can be especially useful when it relates to social engineering. You can easily make victims download malware and trojans and also capture their actual downloads to get sensitive information.
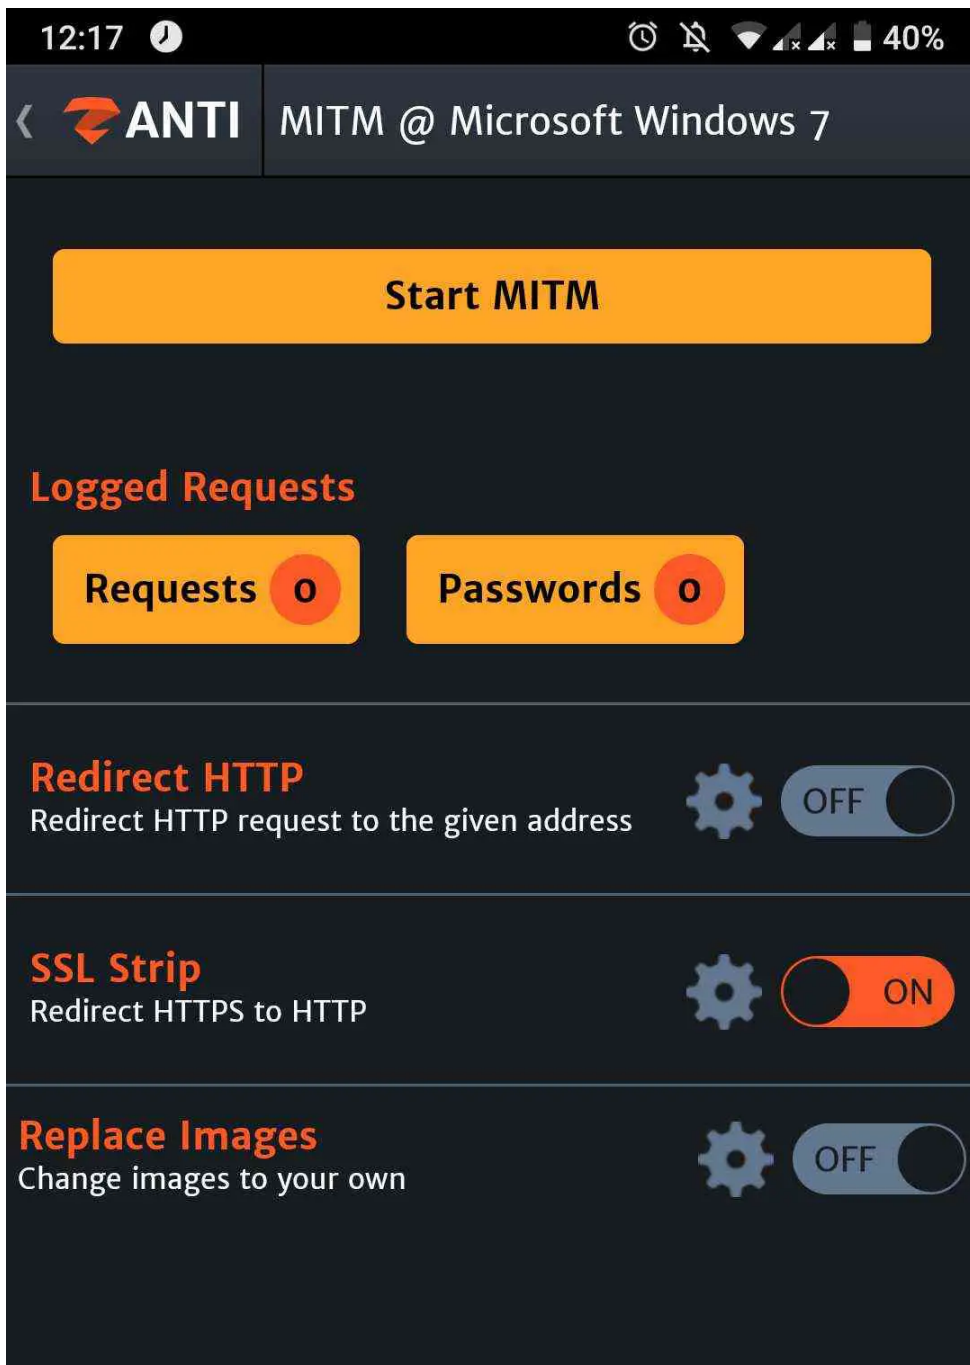

3) Modify HTTP requests and responses-

Use zPacketEditor, which allows you to hack the HTTP requests and responses in your network. It is an interactive mode that can allow you to edit and send each request and response. This is, however, difficult and does not work on every phone.

4) Exploit Routers-

Router pwn is a web application for exploiting router vulnerabilities. It is a collection of "ready to run" local and remote exploits. Use them. Firstly, tap on "Routerpwn.com," then select your router vendor from it. Then you will see many exploits there. Choose any of

them for your hacking. You can also check other
vulnerabilities. Just use google to find more information
about specific vulnerability.

5) Capture Passwords-
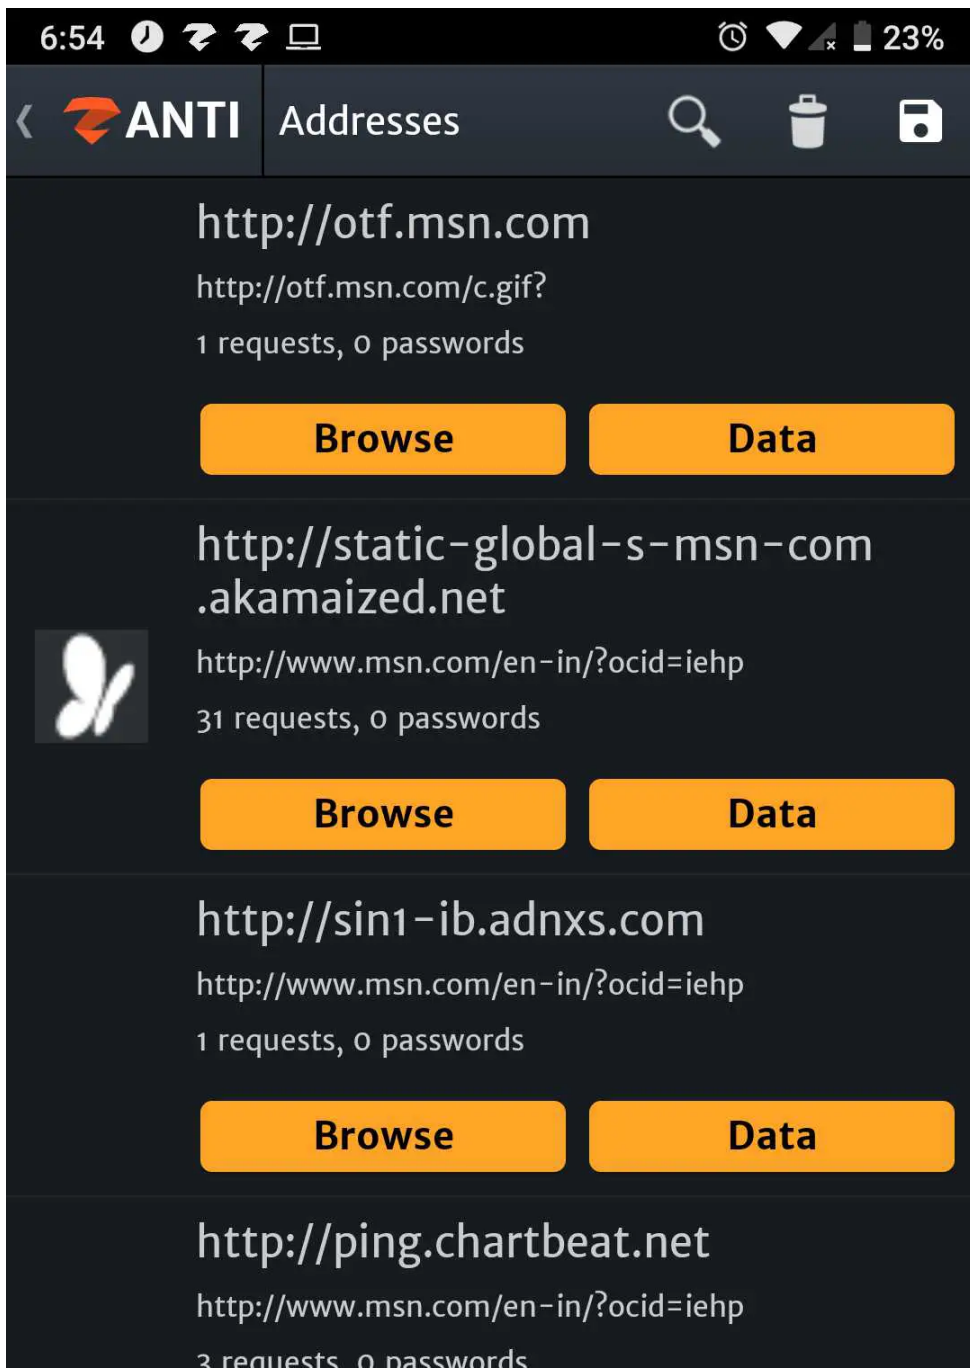

This is the main feature of zANTI with which you can use to capture passwords on the networks. To do that, select the device you want to choose as the target and click on "MITM" button. The results will show in the saved passwords section.

6) How to check a Device for Shellshock and SSL Poodle Vulnerabilities

First, select the device. Then tap on "Shellshock/SSL Poodle." It will start scanning the target device. Wait for some time, and then the result will be displayed. If the device is vulnerable, you can exploit it.
---

7)Nmap scan

Nmap scan gives you all the juicy sensitive information about the target and the network, the open ports, the IP addresses, the operating systems, etc. This can be

very useful to find exploits and hacks regarding the
target.
