How To Find Admin Login Page Of Any Website Using Hacking Tools

Method #1: Using Havij Pro Tool
Download and install Havij Pro which has a cool feature - find admin panel of a specific site.

Method #2: Running Admin Finder Tool Online
You can use some free online tools which are especially designed to find Admin panels of a specific site.

Here are some tools:

http://blog.sosdevelopment.com.au/

Search This Blog

[   ] [Search]

https://www.adminbooster.com/tool/site_review

http://techcens.com/admin-page-finder-online/

Method #3: Burp Spider/Crawler
You can use Burp Spider to crawl your target site and eventually find the admin login page.

Method #4: Looking at /robots.txt File
Add /robots.txt to the main URL of the website - like www.sitename.com/robots.txt

And we'll get something like

```
User-agent: *
Disallow: /search
Allow: /

Sitemap: http://www.sitename.com/sitemap.xml
```

What we need to pay our attention is on the "Disallow" parameter or field.

The page www.sitename.com/search is disallowed - meaning that NO search engine should crawl this specific page. But in most cases many 3rd party crawling software programs doesn't follow this rule - which is good thing for us (hackers).

Why?

For SEO purposes (in this example and probably many more reasons)

Sometimes the Admin may also resist the crawlers but also some other sensitive areas like login page.

So by just looking at robots.txt file will make our job much easier. Got it?

If you're wondering what is **Robots.txt** really?

It's basically telling the crawling programs (such as Search Engines) like Google what to crawl and what NOT to crawl - the content of the website.

Where as **sitemap.xml file** contains-

bunch of links but with other info like time stamp, last updated, etc.,

Method #5: Using Google Dorks
As you know Google is always there for us (hackers), we can take advantage of Google Dorks to find the admin panels of our target site with ease.

Here are some Google dorks that will help you discover admin pages of your target site -

site:www.sitename.com intext:"admin"
site:www.sitename.com intitle:"admin login"
site:www.sitename.com inurl:login

Method #6: Using Various Scripts

1. Install Active Perl

2. Now copy the code from here and save it as anyname.pl

3. Run the anyname.pl script using Active Perl and you will find the admin panel of the site.
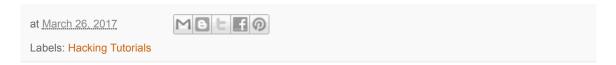

Note: I'm not the author of the above script.

Method #7: Manipulating the URL Links
But this method consumes a lot of time and energy and that's why I put it at the very last.

www.sitename.com/admin
www.sitename.com/admin.php
www.sitename.com/administrator
www.sitename.com/login
www.sitename.com/wp-login.php

But you can find more and relevant URL strings to find Admin Panel here.

ProTip: Use any automation tool like Burp Suite to automate this process, so that you will save some time and energy.
